Abstract: To ensure the energetic security of the country, the continuation of hard coal exploitation cannot be questioned, as it can't be renounced (at least on a medium term) Even if at the present day, the extractive industry of hard coal is uncompetitive compared to the global performances, there are perspectives to continue exploitation in conditions of economical efficiency, by applying some measures that continue and sustain the reform and by developing viable capacities, through technology and modernizations.

Keywords: mining industry, hard coal, production cost, state aid.
