**Abstract:** The current economic and financial crisis has seriously affected the entire Romanian economy. As expected, the labour market has been hit the most. The negative effects of the crisis on this market were reducing the number of employees due to lay-offs and increasing unemployment and wage reduction. This paper, divided into three parts, intends to highlight a series of statistical data, the changes in the labour market as a consequence of the crisis happening in Romania, namely: unemployment, job vacancies and salary level. The first part deals with unemployment from several perspectives: overall, territorial, gender, age groups, economic activities, the number of people with allowance and those who are not paid, the number of those who attended training. In the second part of the paper we present the offer of employment by economic activity at the end of 2010 and the last part is focused on the changes of employees' wage in the private and budgetary sectors.

**Keywords:** financial crisis, unemployment, job offer, salary level
