Abstract: A common observation of daily life in Europe gives the impression of an explosive circulation of people and goods. Mobility statistics confirm this. The current paper approaches the topic of modern mobility, looking at the frameworks that influence the social (physical) mobility at the working place, at the features of current mobility at the working place, at the interactions between the different transport and communications systems and the current requirements of professional life, as well as the social consequences of the increased mobility at the working place.

Keywords: modern mobility, commuters, social individualization, global risk society.
