Abstract: The purpose of this paper is to provide readers with a comparison of the most popular and used software tools for project management, in a phased manner, in order to present a detailed and complete view of the features of these types of software solutions. The research includes a sample of 8 software tools from over 470 such software solutions on the market (according to the source: capterra), these being compared both theoretically and practically, reaching all the interesting points for the potential users. Conclusions show that the diversity of software tools makes them suitable for many types of projects, but also outlines that some software tools lack important features, while others provide novelty and fluidity in use.

Keywords: project management, software, planning
