Abstract: Risk management is designed to address the right risk response, using various analytical and operational methods and tools to identify, prioritize and adopt appropriate loss prevention measures and achieve the organization's goals. At the strategic level, it is important for any manager to identify, through analysis, the potential risks to which the organization is exposed so that the decision achieves the intended purpose. In technical schools, risk management in the students' practical training requires effective collaboration and communication with the economic agents and giving high importance to the safety of the students in the educational process.

Keywords: risk, practical training, safety, risk management
