Abstract: The present paper aims to present a case study in the concrete field of good practices for developing the methods used in higher education. In the current economic context, universities are facing financial difficulties that do not allow an efficient development of the links between the economic, social and students environment. The problem is an important one, because there is a need for a bridge, especially in the technical field, between reality and what is mostly taught, between the practical activities of the students and what is desired of them in society once they become adults. If we overlap all these problems with the level of globalization of the business environment, the academic one and the social one, we face interesting challenges. Thus, one of the solutions addressed is the voluntary involvement of students in national and international events, under the huge umbrella of the European network ESTIEM. The impact of this initiative on students is presented in this paper.
