**Abstract:** Carrying out a study on the analysis of the phenomenon of serious traffic accidents, which generate life threatening risks, as well as risks for the people's physical and mental integrity, their health, or their property, cannot be complete and complex without having a perspective on its evolution and dynamics within a time interval and, at the same time, without determining its manifestation tendencies with regard to regions, places, or occurrence environments, simultaneously establishing its causality. Through the present research or study, we want to present the general and specific manifestation tendencies of the road hazard phenomenon along National Road 7, "Sibiu – Pitesti," during a well determined period, which we believe to be significant, that is the past 5 years, more exactly, the period between 2015 and 2019. We would like the present analysis material to represent a continuation of the increasing and constant interest for the conceiving, implementation and perfecting of the preventive measures in the domain of roads, with respect to, directly, the characteristics and traits referring to the most important and well known road-traffic factors, that is the human factor, the road factor, the vehicle factor, law and road transport legislation, and, last but not least, the causes generating road accidents, as compared to the modality and the mechanisms of occurrence.
