Abstract: In the projects theory are generalized two levels (types) of analysis: the economical and the financial ones. Public projects of an economical nature (where, for now, the mining enterprises which can be assimilated within the state property) and the big projects (that cannot be financed only with private capital, and the state intervention is required) impose taking into consideration of a third level of analysis. This is about the analysis on a national economy level, which does not limit anymore on the calculation of some economic and financial efficiency indicators in the project, but follows emphasizing and quantification of the global effects produced by these (influx growth in the consolidated state budget, an increased degree of occupation in population, improvement of the social condition in certain areas, improvement of the external payment balance etc.)

Keywords: mining project, assessment, economical analysis, financial analysis, effects method.
