Abstract: This paper aims to present a study conducted within a manufacturing company. Here, it started from tracking the route of obtaining a new blank in the departments involved in this production stream. During the course of the study, it was at the end of the production flow that a number of non-conformities appeared on the finished products. These nonconformities have been identified, analyzed, and established the causes that led to their occurrence. They were a problem for the company because they did not meet the customer's requirements, and on the other hand they were causing losses for the company. To solve these nonconformities, solutions have been proposed.

Keywords: nonconformities, production flow, quality, control.
